## General Information

### LESER – Modulate Action Safety Valves

The Modulate Action product group stands for

- ✓ Suitable solutions for all areas of applications, especially thermal expansion
- ✓ Lowest possible loss of medium
- ✓ Compact construction and low weight

#### LESER Modulate Action Safety Valves

- are characterised by longstanding proof in service and are constantly optimised by service specialists.
- are available as standard safety valves.
- reach their full lift within a pressure increase of 10% above the set pressure
- are suitable for almost all industrial applications.
- are accepted by numerous rules and regulations and approved by leading classification societies.

Examples of this are:

- European Community: CE marking in accordance with Pressure Equipment Directives (PED) 2014/68/EU and DIN EN ISO 4126-1
- Germany: VdTÜV approval as per Pressure Equipment Directive, EN ISO 4126-1, TÜV SV 100 and AD 2000-Merkblatt A2
- China: AQSIQ based on the approvals as per AD 2000-Merkblatt A2
- Eurasian Custom Union: Approval acc. to Eurasian Custom Union (EAC - Eurasian Conformity)

Furthermore, all LESER Modulate Action safety valves are designed, marked, produced and approved according to the requirements of the following regulations (directives, codes, rules and standards): EN ISO 4126-7, EN 12266-1/-2, EN 1092 Part I and II Flange, ASME B 16.34 and ASME B16.5- Flange, AD 2000-Merkblatt A4, AD 2000-Merkblatt HP0.

LESER Modulate Action safety valves can be used for all steam, gas, and liquid applications and are characterised by their low loss of medium.

The Series 433 standard safety relief valves have component testing according to AD 2000-Merkblatt A2 for steam, gases, and liquids.

## General Information

### Applications

#### LESER – Modulate Action Safety Valves

provide the ultimate solution for all industrial applications with steam, gasses, and liquids.

#### Series 433 standard safety valves

#### acc. to definition AD 2000-Merkblatt A2

are ideal relief valves for medium mass flows. Their greater proportional range leads to a constant mode of operation and relief of pressure peaks for liquids in particular.

Typical applications for LESER Modulate Action Series 433 safety valves are:

- chemical industry
  - recycling facilities: Low medium loss
  - piping with long line lengths
  - two-phase flow
  - waste gas purification systems on the outlet side
- heat-transfer oil systems
- liquids protection
  - metering pumps
  - hydraulic systems
  - pulsating operating pressures
- machine building (OEM)
  - piston compressors with small and medium capacities
- overflow function
- thermal expansion
  - protection of pipeline segments
  - sealed storage tanks

Standard safety valves are characterised by particularly stable operation.

### General design feature

#### LESER – Modulate Action Safety Valves

offer a large number of models, materials, and accessories for adaptation to any application:

- 11 valve sizes from DN 15 to DN 150 – 1/2" up to 6" with connection possibilities for the respective application
- Nominal pressure ratings from PN 16 to PN 160 / Class 150 to Class 600 fulfil most pressure requirements
- Orifice 0.2 x D to > 1.1 x M cover all common performance requirements.
- The required material for the application can be chosen from the large choice of body materials, for example:
  - 0.6025 / cast iron
  - 0.7043 / ductile iron
  - 1.0619 / WCB
  - 1.4408 / CF8M
- centre to face dimensions acc. to DIN 3320
- set pressures from 0.2 to 160 bar qualify Modulate Action safety valves for all industrial systems
- operating temperatures from -270 to 450 °C make use possible in numerous applications
- LESER Nanotightness as standard for metal-to-metal sealings. The nanotightness exceeds the requirements for functional tightness of API 527 by 50% which means e.g. less pollution when discharge to atmosphere, 50% reduction in medium loss and increased plant efficiency
- compact construction and low weight for easy handling
- same nominal inlet and outlet diameter
- identical construction for steam, gasses and liquids (single trim) reduces the number of required spare parts and facilitates cost-effective maintenance
- construction without a blow down ring guarantees easy service and prevents incorrect settings of the blow down ring
- the one-part spindle reduces friction, guarantees optimal guidance and reliable operation under all operating conditions
- the self-emptying angle type body prevents residue and reduces corrosion

LESER – Modulate Action safety valves can be individually adapted to the applications with a multitude of accessories. Examples are:

- discs with soft seal (O-ring) fulfil increased demands of functional tightness
- stellited or hardened metal seat surfaces of disc and seat reduce the wear and increase the service life
- balanced bellows for compensation of the back pressure and to protect the moving parts
- heating jacket for heating the safety valve when protecting cold stiff media
- each component can be constructed of an alternative material according to customer specifications

## How to use

General signs and symbols		Signs and symbols for flange drillings and flange facings	
*	Standard	*	Standard construction, specification of an option code not necessary
✓	Available	(*)	Flange dimensions with exception of flange thickness as per flange standards (e.g. ASME B16.5) Flange thickness is less (max. 2 mm), see "Hole patterns valid for different pressure ratings"
-	Not possible	-	Flange hole pattern / sealing surface not possible

### Option code for flange drillings and dimensions, e.g. H50

H50	Flange drilling as specified in flange standard Outer flange diameter, flange thickness and height of flange facing may be larger, see "Dimensions"
(H50)	Flange dimensions except flange thickness are in accordance with standards (e.g. ASME B16.5) Flange thickness is smaller (max. 2 mm), see "Multiple pressure rating"
Stock Fini	Flange drilling as specified in standard. Flange thickness may be less than the flange outer diameter as specified in the standard, however complete nut support area is available

### Option code for flange sealing surfaces, e.g. L36

L36	Flange facing as specified in standard (e.g. Flange facing inlet Type B2 "smooth finish")
-----	---

### General information concerning flange drillings and flange facings

Multiple pressure rating	The flange standard shows the same drilling, facing and outer diameter for several pressure ratings, e.g. from PN 16 to PN 40. Due to the pressure rating of the body, LESER fulfills the requirements for flange thickness, e.g. PN 16 but not PN 40.
Smooth Finish	In the applicable MSS SP-6 (Edition 2001), "Smooth Finish" is no longer mentioned. In MSS SP-6 (Edition 1980), "Smooth Finish" was defined as the surface quality of the flange with "250 µinch (6.3 µm) AARH max.". LESER supplies flange sealing surfaces according to ASME B16.5 – 1996, Paragraph 6.4.4.3: "Either a serrated concentric or serrated spiral finish resulting in service finish from 125 to 250 µinch average roughness shall be furnished" This finish meets the requirements of MSS SP-6 (Edition 1980), which is not valid anymore!
Stock Finish	"Stock Finish" is not defined in any technical standard. If "Stock Finish" is specified in the order, then LESER delivers standard flange sealing surfaces as per DIN or ASME (marked with * in the "Flange sealing surfaces" table for each series).

### Pressures – Symbols in use

Symbols	Name	Metric units
p	Set pressure	bar
$p_0$	Absolute pressure in vessel $= p \cdot 1.1 + 1.013$ $= p \cdot 1.1 + 14.5$	bar <sub>a</sub>
	The overpressure is 10% of the set pressure, but at least 0.2 bar	
$p_a$	Back pressure	bar
$p_{a0}$	Absolute back pressure $(= p_a + 1.013)$ $(= p_a + 14.5)$	bar <sub>a</sub>

### Materials

In the table below, you will find a list of the LESER material codes. Please take into consideration that

- material quality certificate 3.1 acc. to EN 10204 is available for each body material
- material quality certificate 3.1, which certifies different materials, is available for many materials.

Material code	Valve body with flanges	Body material is certified acc. to 3.1 (EN 10204) for the following materials	
		acc. to DIN EN	acc. to ASME
xxx1.XXXX	Grey iron	0.6025	Cast iron
xxx2.XXXX	Carbon steel	1.0619	WCB, WCC
xxx4.XXXX	Stainless steel	1.4408, 1.4581	CF8M (Charpy Test at -196°C), CF10M
xxx5.XXXX	Nodular cast iron	0.7043	Ductile Gr. 60-40-18

For an explanation of the characters and symbols, refer to page 6.

Note: Flange drillings and facings always meet the requirements of the given flange standards.

Flange thickness and outside diameter may deviate from the standard.

## Type 431, 433

### Flange facings

Flange facings										
Information	Standard	Inlet	Outlet	Remark						
<b>General</b>										
Flange, undrilled	-	H38	H39							
Linde-V-Nut, Form V48	Linde Standard 420-08	J07	J08	Groove: Rz = 16						
Linde-V-Nut, Form V48A	LDeS 3313.36	J05	J06	Groove: Rz = 4, e.g. for hydrogen						
Lens-shape seal form L (without lens-shape seal)	DIN 2696 LDeS 3313.35	J11	-							
<b>According to DIN EN 1092</b>										
Flange facings		Inlet	Outlet	Remark						
DIN EN 1092 (also see LDeS 3313.40)										
Raised face	Form B1	*	*	Facing: Rz = 12.5 – 50						
	Form B2	L36	L38	Facing: Rz = 3.2 – 12.5						
Tongue, Form C <sup>1)</sup>		H94	H92	only for steel flange						
Groove, Form D <sup>1)</sup>		H93	H91							
Male, Form E		H96	H98							
Female, Form F		H97	H99							
O-ring Male, Form G		J01	J02							
O-ring Female, Form H		J03	J04							
<b>According to ASME B16.5</b>										
Body material	Inlet	Outlet	Smooth Finish <sup>2)</sup>	Serrated Finish	RTJ-Groove					
			Inlet	Outlet	Inlet	Outlet	Inlet			
			Option code		Option code		ANSI Class	Option code		
0.7043	all	all	L52	L53	*	*	-	-	-	-
1.0619, 1.4408	all	all	L52	L53	*	*	150	H62	150	H63

<sup>1)</sup> LESER manufactures the groove at flanged valves by milling. If a customer demands a turned surface in the soil of the groove according to DIN EN 1092-1 an additional option code is necessary: "S01: soil of the groove drilled".

<sup>2)</sup> Smooth Finish is not defined in the effective standards.

For signs and symbols refer to page 6

Note: Flange drillings and facings meet always the requirements of mentioned flange standards.

Flange thickness and outer diameter may vary from flange standard.

### Capacities – water

Calculation of the capacity for water acc. to AD 2000-Merkblatt A2 with 10% overpressure at 20 °C.  
Capacities at 1 bar and lower are calculated at 0.1 bar overpressure.

Metric units	AD 2000-Merkblatt A2 [10 <sup>3</sup> kg/h]

### Determination of coefficient of discharge in case of lift restriction or back pressure

Diagram for evaluation of ratio of lift / flow diameter ( $h/d_0$ ) in reference to the coefficient of discharge ( $K_{dr}/\alpha_w$ )

$h$	= Lift [mm]
$d_0$	= Flow diameter [mm] of selected safety valve see "Article numbers" table
$h/d_0$	= Ratio of lift / flow diameter
$p_{a0}$	= Back pressure [bar <sub>a</sub> ]
$p_0$	= Set pressure [bar <sub>a</sub> ]
$p_{a0}/p_0$	= Ratio of back pressure / set pressure
$K_{dr}$	Coefficient of discharge acc. to DIN EN ISO 4126-1
$\alpha_w$	Coefficient of discharge acc. to AD 2000-Merkblatt A2
$K_b$	Back pressure correction factor acc. to API 520 Section 3.3

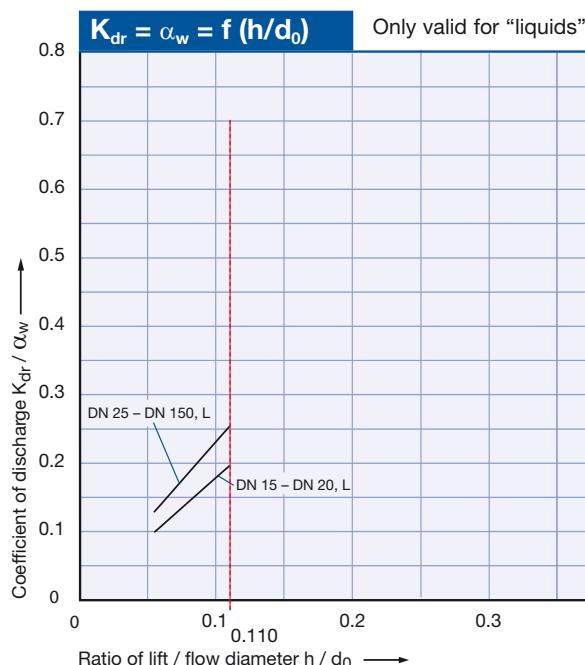

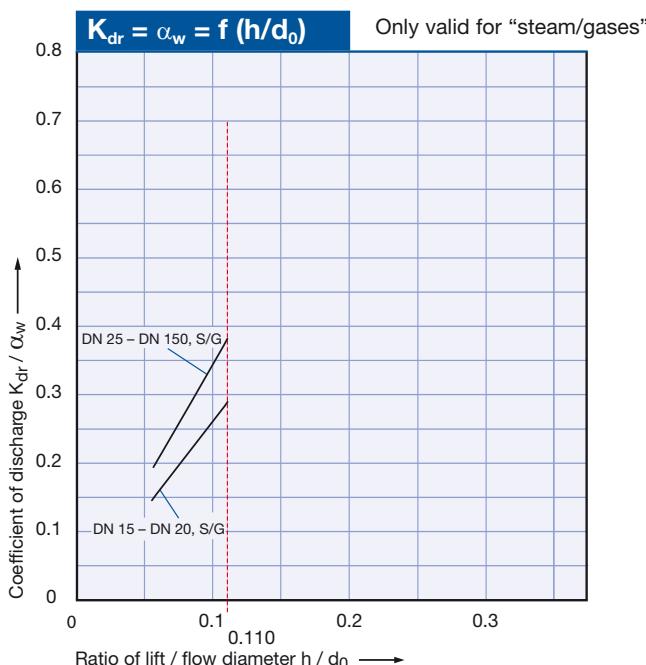

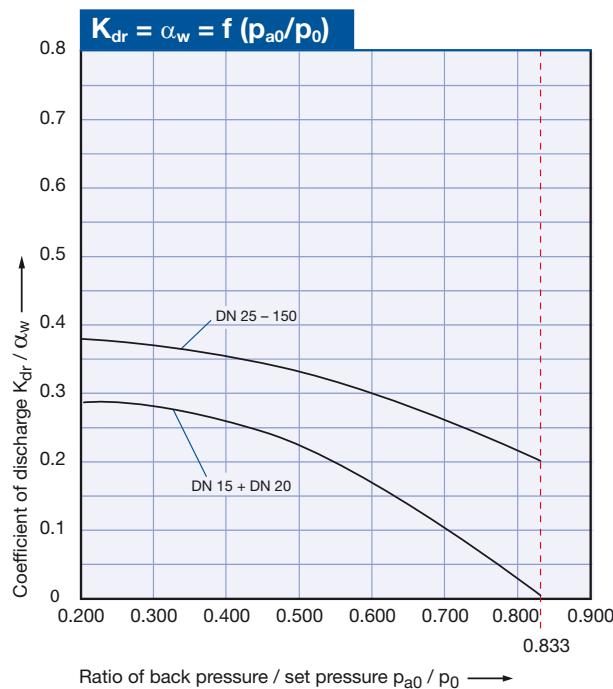

Diagram for evaluation of coefficient of discharge ( $K_{dr}/\alpha_w$ ) or  $K_b$  in reference to the ratio of back pressure / set pressure ( $p_{a0}/p_0$ )

<sup>1)</sup> LESER manufactures the groove at flanged valves by milling. If a customer demands a turned surface in the soil of the groove according to DIN EN 1092-1 an additional option code is necessary: "S01: soil of the groove drilled".

<sup>2)</sup> Smooth Finish is not defined in the effective standards.

For signs and symbols refer to page 6.

Note: Flange drillings and facings meet always the requirements of mentioned flange standards.

Flange thickness and outer diameter may vary from flange standard.

### Determination of coefficient of discharge in case of lift restriction or back pressure

Diagram for evaluation of ratio of lift / flow diameter ( $h/d_0$ ) in reference to the coefficient of discharge  $K_{dr}/\alpha_w$

$h$	= Lift [mm]
$d_0$	= Flow diameter [mm] of selected safety valve see "Article numbers" table
$h/d_0$	= Ratio of lift / flow diameter
$p_{a0}$	= Back pressure [bar <sub>a</sub> ]
$p_0$	= Set pressure [bar <sub>a</sub> ]
$p_{a0}/p_0$	= Ratio of back pressure / set pressure
$K_{dr}$	= Coefficient of discharge acc. to DIN EN ISO 4126-1
$\alpha_w$	= Coefficient of discharge acc. to AD 2000-Merkblatt A2
$K_b$	= Back pressure correction factor acc. to API 520 Section 3.3

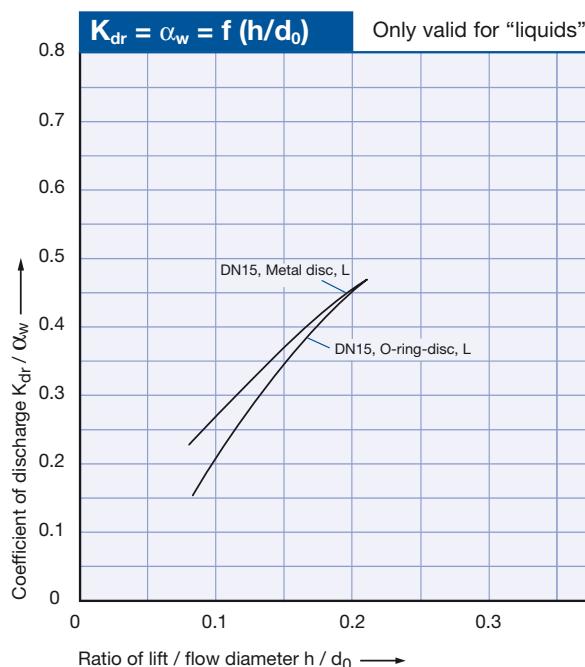

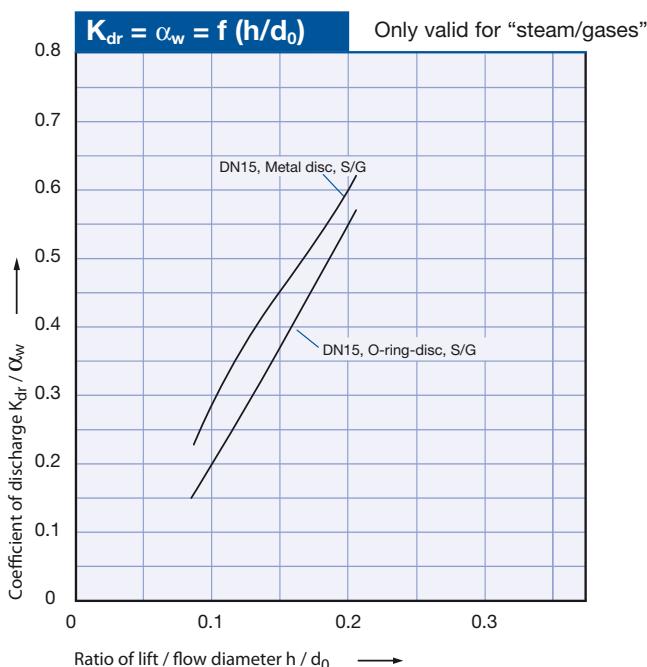

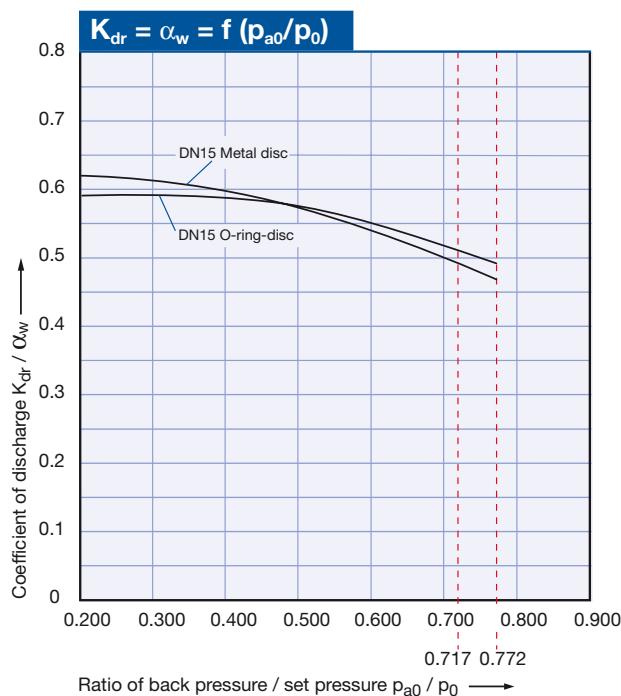

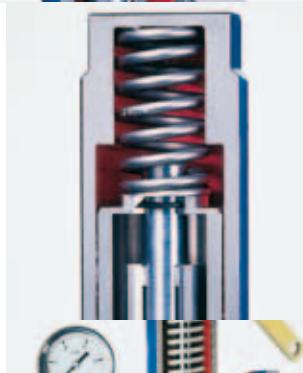

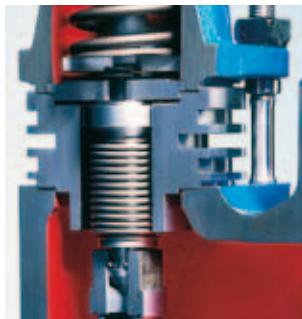

Diagram for evaluation of coefficient of discharge ( $K_{dr}/\alpha_w$ ) or  $K_b$  in reference to the ratio of back pressure / set pressure ( $p_{a0}/p_0$ )

### Caps and levers – subassembly item 40

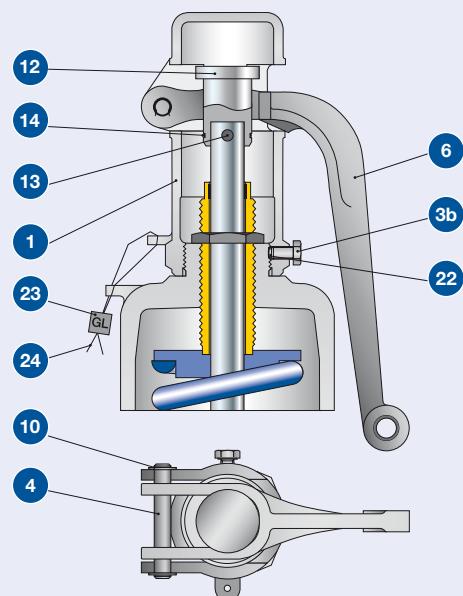

**Cap H2**

**Packed lever H4**

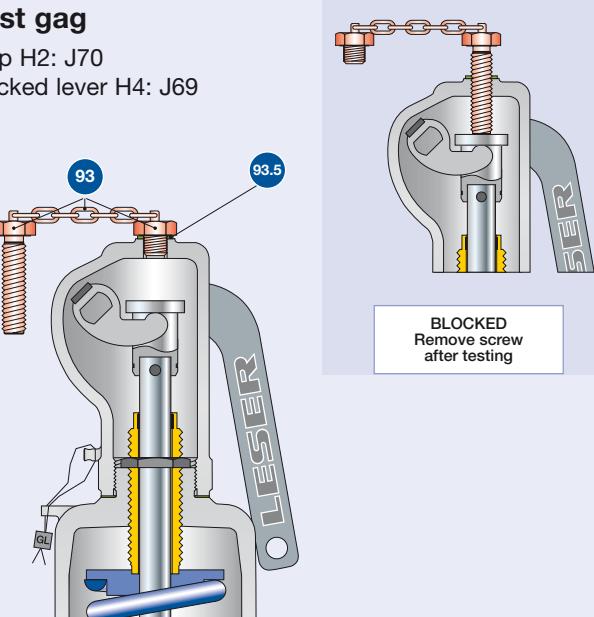

**Plain lever H3**

**Test gag**

Cap H2: J70  
Packed lever H4: J69

### Test gag

The test gag prevents the spindle from lifting and keeps the safety valve tight while the system pressure exceeds the set pressure.

#### The test gag is used to:

- perform the pressure test in a system without disassembling the safety valve
- be able to make an adjustment to each individual valve in systems with multiple safety valves

The test gag must be removed after testing, otherwise the safety valve will not protect the system against impermissible overpressure.

- LESER reserves the right to make changes
- LESER may use higher quality materials without giving prior information
- Each component can be constructed of another material according to the customer's specification.

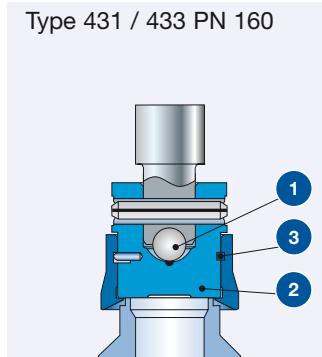

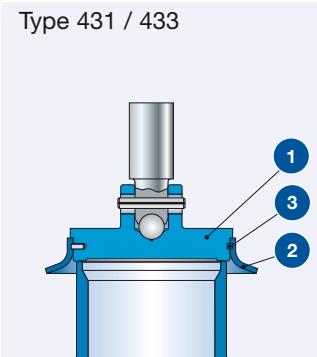

## Accessories and Options

### Metal seat – seat / nozzle, item 5 and disc subassembly item 7

LESER safety valves are supplied with Nanotightness as a standard and therefore exceed requirements for functional tightness of the API 527 by 50%. The LESER Nanotightness is produced by multistage lapping, grinding and polishing processes and ensures flatness and roughness of the sealing surfaces like in the nanometer range.

The detachable lifting aid is standard with safety valves of Type 431 / 433 and Type 431 / 433 PN 160. The benefit of the detachable lifting aid is the easy re-lapping of the disc sealing surface on one disc.

This makes it possible to have fast maintenance of the safety valve on site.

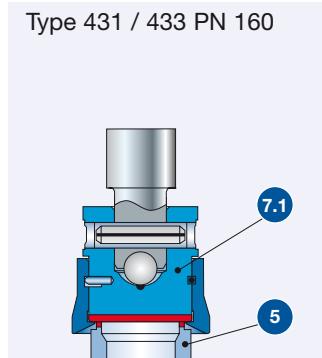

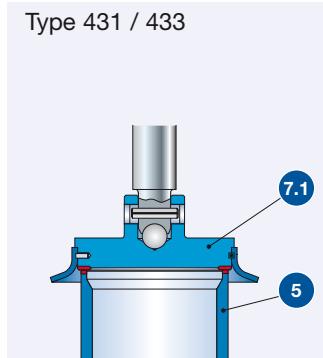

### Stellited sealing surface

The sealing surfaces of stainless steel discs and seats / nozzles can be stellited by weld cladding. Stellite is a cobalt-chrome non-ferrous alloy with increased hardness, corrosion resistance, and abrasion resistance even at high temperatures.

LESER recommends stellited sealing surfaces for Modulate Action safety valves (seat / nozzle and disc (1.4404 / 316L)) in the following applications:

- for high-pressure applications with highly stressed sealing surfaces
- for high-temperature applications in order to prevent permanent deformation of the sealing surface as a consequence of the material properties of the seat and disc
- use with abrasive media in order to increase the abrasion resistance of the sealing surface

Materials for disc and seat / nozzle, see page 45.

Hardness		Metal seat		
Material		Hardness of the sealing surface		
EN	ASME	Value according to standard or manufacturer specification		Mean value LESER bearing material
EN 10088-3, 1.4122 hardened	Chrome steel, hardened	≥ 40 HRC	LDeS 4325.01 hardening process	42 – 46 HRC
EN 10272, 1.4404	SA 479 316L	≤ 215 HBW	EN 10272 Table 7	16 – 19 HRC <sup>1)</sup>
EN 10272, 1.4404 stellited	SA 479 316L stellited	≥ 35 HRC	Manufacturer specification	40 HRC

HBW: BRINELL hardness acc. to DIN EN ISO 6506-1 / HRC: ROCKWELL hardness acc. to DIN EN ISO 6508-1

<sup>1)</sup> Rockwell hardnesses less than 20 HRC are not approved by the standard. LESER gives these values for better comparability.

## Accessories and Options

### Disc with soft seal – subassembly item 7

#### Features and Benefits

LESER soft seal solutions allow for superior tightness.

- Two different designs with o-ring or sealing plate for a wide variety application
- Large selection of soft seal materials to best adapt to the application
- Increased service life of sealing surfaces compared to a metal to metal seat

- Simple replacement of the soft seal reduces maintenance costs
- Standard ARP O-ring sizes for easy worldwide procurement
- One standard durometer per O-ring material for all set pressures to reduce stocking expenses

## NACE

### NACE-Compliant Safety Valves

#### General requirements for safety valves in sour gas service

Media such as sour gas, which is especially common in oil and gas production, can have a corrosive effect on safety valves. The National Association of Corrosion Engineers (NACE) is a global association that deals with the development of corrosion control measures and defines these in standards such as NACE MR0175 and NACE MR0103. Both of these standards identify requirements for metallic materials used for piping and related components, to include safety valves, in the oil and gas industry.

The aim here is to protect the environment from escaping media. The focus is on the prevention of various types of corrosion (e.g. sulfur-induced stress corrosion cracking) of used materials that can be caused by acidic media.

Both standards define the maximum material hardness for prevention of corrosion damage because hardness increases corrosion resistance. NACE MR0175 provides requirements for materials used in oil and gas extraction (upstream) whereas NACE MR0103 specifies less stringent requirements for materials used in refinery processes (downstream).

Various components of LESER safety valves can be constructed in corrosion resistant materials using a level concept. This way, LESER can offer efficient safety valve solutions according to the requirements of NACE MR0175 and NACE MR0103 for different application conditions.

#### Norms

NACE MR0175/ISO15156 – 2015

1 Scope: This part of NACE MR0175/ISO 15156 describes general principles and gives requirements and recommendations for the selection and qualification of metallic materials for service in equipment used in oil and gas production and in natural-gas sweetening plants in H<sub>2</sub>S-containing environments, where the failure of such equipment can pose a risk to the health and safety of the public and personnel or to the environment.

NACE MR0103 – 2015

1 Scope: This standard establishes material requirements for resistance to SSC in sour petroleum refining and related processing environments containing H<sub>2</sub>S either as a gas or dissolved in an aqueous (liquid water) phase with or without the presence of hydrocarbon.

Specifically, this standard is directed at the prevention of SSC of equipment (including pressure vessels, heat exchangers, piping, valve bodies, and pump and compressor cases) and components used in the refining industry.

LESER standard: LDeS 3001.91

	Level 1		Level 2	
Part definition	Contact with the medium in closed position		Contact with the medium in opened position	
Contact surfaces	Conventional	Balanced bellows	Conventional	Balanced bellows
Safety valve operation	closed		opened	
Parts concerned	Body, seat, disc	Body, seat, disc	all	Body, seat, disc, bonnet spacer, bellows

LESER already uses NACE compliant materials as standard for many of its components. This means that material adjustments are required for only certain components – these are listed in the table below.

Necessary material modification NACE MR0175/ISO 15156 – 2003 (Option code N78) and NACE MR0103 – 2012 (Option code N77)

## Accessories and Options

### Balanced bellows – subassembly item 15

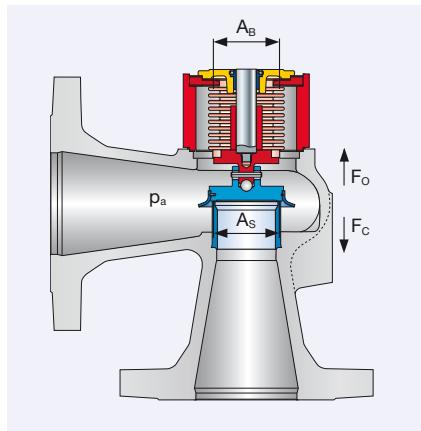

Balanced bellows are generally used for two applications:

- to compensate for back pressure
- to seal off the bonnet from the outlet chamber

#### Compensation for back pressure

The back pressure acts on the reverse side of the disc, creating a force in the closing direction ( $F_C$ ). The balanced bellows constitutes an area equal to the seat area, creating a force acting in the opening direction ( $F_O$ ), thus compensating the force in closing direction.

A quantitative representation is shown in the table below:

Actual area	Back pressure	Actual force	Direction of force	Compensation criteria
Seat area = $A_S$	$p_a$	$F_C = p_a \times A_S$	closing	$A_S = A_B$
Bellows area = $A_B$	$p_a$	$F_O = p_a \times A_B$	opening	$F_C = F_O$

#### Sealing the bonnet from the outlet chamber

LESER's balanced bellows seal the spring chamber to the blow-off chamber. That way, they protect the guides, moving parts, and the spring against media-related affects such as dirt, corrosion, impurities, and also temperature.

Balanced bellows		
Type	431 / 433	431 / 433 PN 160
Design		
Bonnet spacer	*	*
Bellows housing	—	*
The shield protects the bellows against flow turbulence when blowing off the valve. Vibrations in the bellows are reduced. This guarantees a longer service life of the bellows.		
Control thread	DIN ISO 228-1, G 1/4 ASME B1.20.1 NPT 1/2"	* ✓

To check the effectiveness of the bellows, an inspection connection G 1/4 is inserted into the bonnet as per DIN ISO 228-1.

For safe discharge, especially of aggressive, toxic media, a discharge pipe G 1/4 can be installed if necessary.

## Accessories and Options

### Heating jacket

### Application and construction

To protect systems with viscous, crystallising or sticky media, LESER offers a heating jacket.

The heating jacket has a welded design and covers the angle type body such that it allows the hot media (steam, oil, and so on) to flow through the created space.

In order to protect the spindle and moving parts against sticking, a safety valve with a balanced bellows construction should be chosen for the heating jacket construction.

For safety valves with balanced bellows, the bonnet spacer needed to accommodate the bellows is equipped with an additional heating jacket. Both heating jackets are joined by a threaded pipe bend.

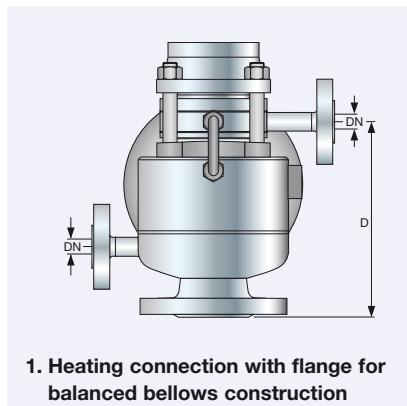

If there is no danger of the medium setting in the blowoff chamber of the valve, then the balanced bellows don't have to be used. The position of the heating connections is shown in figures 1 to 3.

### Specification for the heating jacket

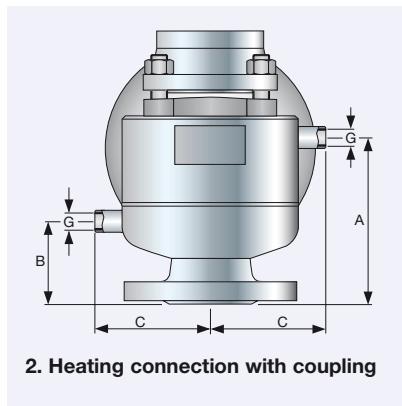

The operating data of the heating jacket is placed on an additional heating jacket rating plate on the heating jacket.

### Slip-on flange

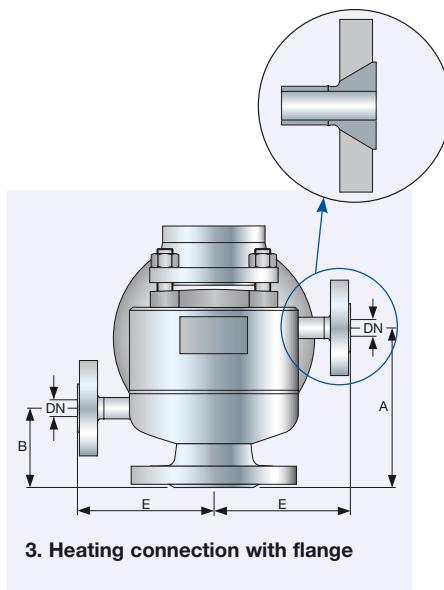

Heating connections with flanges are designed for better orientation than slip-on flanges

1. Heating connection with flange for balanced bellows construction

2. Heating connection with coupling

3. Heating connection with flange

### O-ring damper – subassembly item 40

The O-ring damper successfully prevents or reduces the vibrations of the moving parts of a safety valve.

#### Background:

In each safety valve, the moving parts – the disc, spindle, bottom spring plate and spring – form a so-called spring-mass-system. As in all spring-mass-systems, the components can be stimulated to start vibrating under unfavourable conditions (e.g. loss of inlet pressure). Vibrations can also be triggered by external units and then transferred to the safety valve via the mechanical connection or the medium. In the event of resonances, the safety valve opens and closes in an uncontrolled way at a high frequency and can't discharge the accorded mass flow.

In general, there are two types of uncontrolled vibrations (definition as per ASME PTC 25-2001, Chapter 2.7):

**Chatter:** "Abnormal rapid reciprocating motion of the movable parts of a pressure relief valve in which the disc contacts the seat." The reasons for chatter may include, among other things, too high inlet pressure loss, inadmissible back pressure, or operation in partial load ranges.

**Flutter:** "Abnormal rapid reciprocating motion of the movable parts of a pressure relief valve in which the disc does not contact the seat." The causes of flutter with small and difficult to measure amplitudes are vibrations coming from external sources. Possible external sources are piston compressors or pumps. The vibration can be transferred to the safety valve mechanically via the connections or through the medium.

Based on extensive experience with safety valves, LESER developed the o-ring damper on its certified test benches. The o-ring damper prevents the vibration of moving parts or reduces them to a non-critical frequency and amplitude. Nevertheless, the safety valve operates within the limits of the rules and regulations and standards. Through a special design, the o-ring damper can be used for any type of vibrations.

LESER offers the o-ring damper integrated in the cap H2 and as a modified lifting device H4. For applications with friction-reducing media, e.g. oil, a balanced bellows design is provided to protect the o-ring damper against the medium.

#### Available design

## Accessories and Options

### Elastomer bellows

### Application

Bellows seal the spring chamber to the blow-off chamber. That way, they protect the guides, moving parts, and the spring against media-related affects such as dirt, corrosion, and impurities. The elastomer bellows provides a cost-effective alternative to the balanced bellows.

The range of applications for the elastomer bellows is limited by:

- Chemical resistance
- Medium temperature
- Set pressure
- Back pressure

Elastomer bellows	
Design	
Construction	Easy, compact, and single-ply construction facilitates installation in small blow-off chambers. The one-piece design also facilitates easy replacement and extends the service life.
Flexibility	The special shape of the elastomer bellows provides good spindle mobility and prevents wear and tear.
Inspection hole	To check the effectiveness of the bellows, an inspection hole ( $\varnothing$ 10 mm) is put into the bonnet. This makes it possible to check the seal tightness of the bellows. In the event of a fault in the bellows, the medium leaks from this hole.
Construction height	No change

### Materials

## Accessories and Options

### Lift indicator

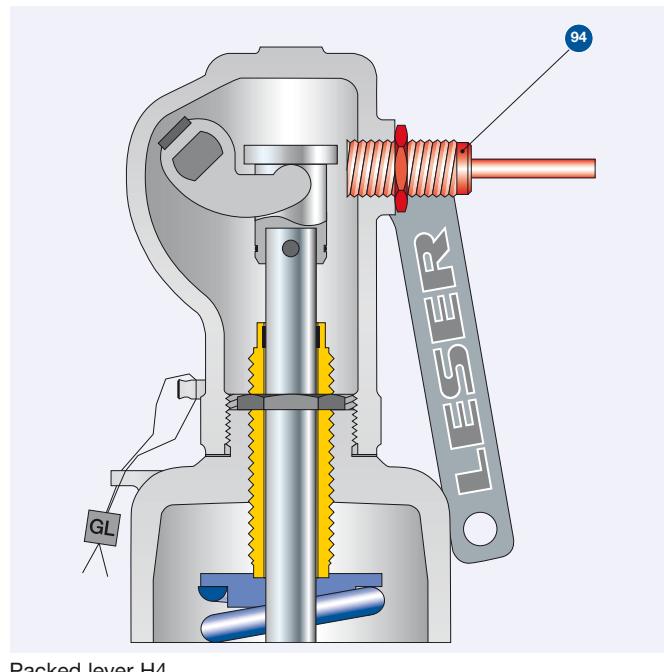

The lift indicator is used in the process technology to monitor the operating condition of a safety valve. Depending on the type of valve, LESER equips the packed lever H4 or the bonnets with the receptacle for the lift indicator. For safety valves with lift indicators, the opening of the valve during opening or the lifting operation is signalled as of a specific lift (min. 1mm).

LESER uses inductive DC lift indicators with two-wire technology Type DIN EN 60947-5-6 (NAMUR). The indicators are approved for use in explosion-prone areas of Zone 0 (Ex II 1 D Ex iaD 20 T6). Other indicators that meet customer specifications can be used.

Technical data for lift indicators can be found on the manufacturer's homepage:  
[www.pepperl-fuchs.com](http://www.pepperl-fuchs.com)

### Gas-tight construction on request!

For installation instructions for lift indicators, see WI 3323.02.

Packed lever H4

### Availability

Item.	Name	Option code
40	Packed lever H4 with receptacle for lift indicator M18 x 1 [mm]	J39
94	Lift indicator M18 x 1, used type = PEPPERL+FUCHS NJ5-18GK-N	J93

### Functional diagram

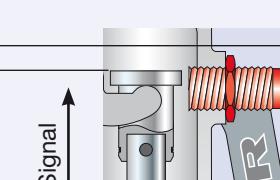

A, closed

B, open

For a closed valve, the lift indicator is positioned on the side, in front of the coupling or the control sleeve.

If the safety valve opens or if the safety valve is vented (in both cases, min. 1 mm) the lift indicator changes its state and switches. If the lift indicator unscrews, e.g. due to vibrations, there is also a switching operation.

## Accessories and Options

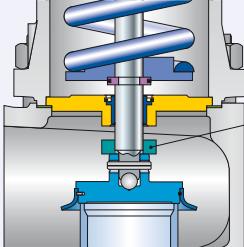

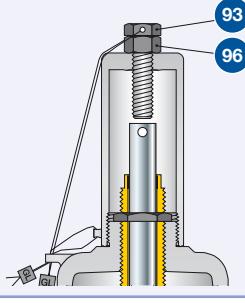

### Lift restriction

The Lift restriction is used to adjust the safety valve to the required discharge mass flow and does not affect the operation of the safety valve.

A lift stopper must meet the requirements of the following codes and standards.

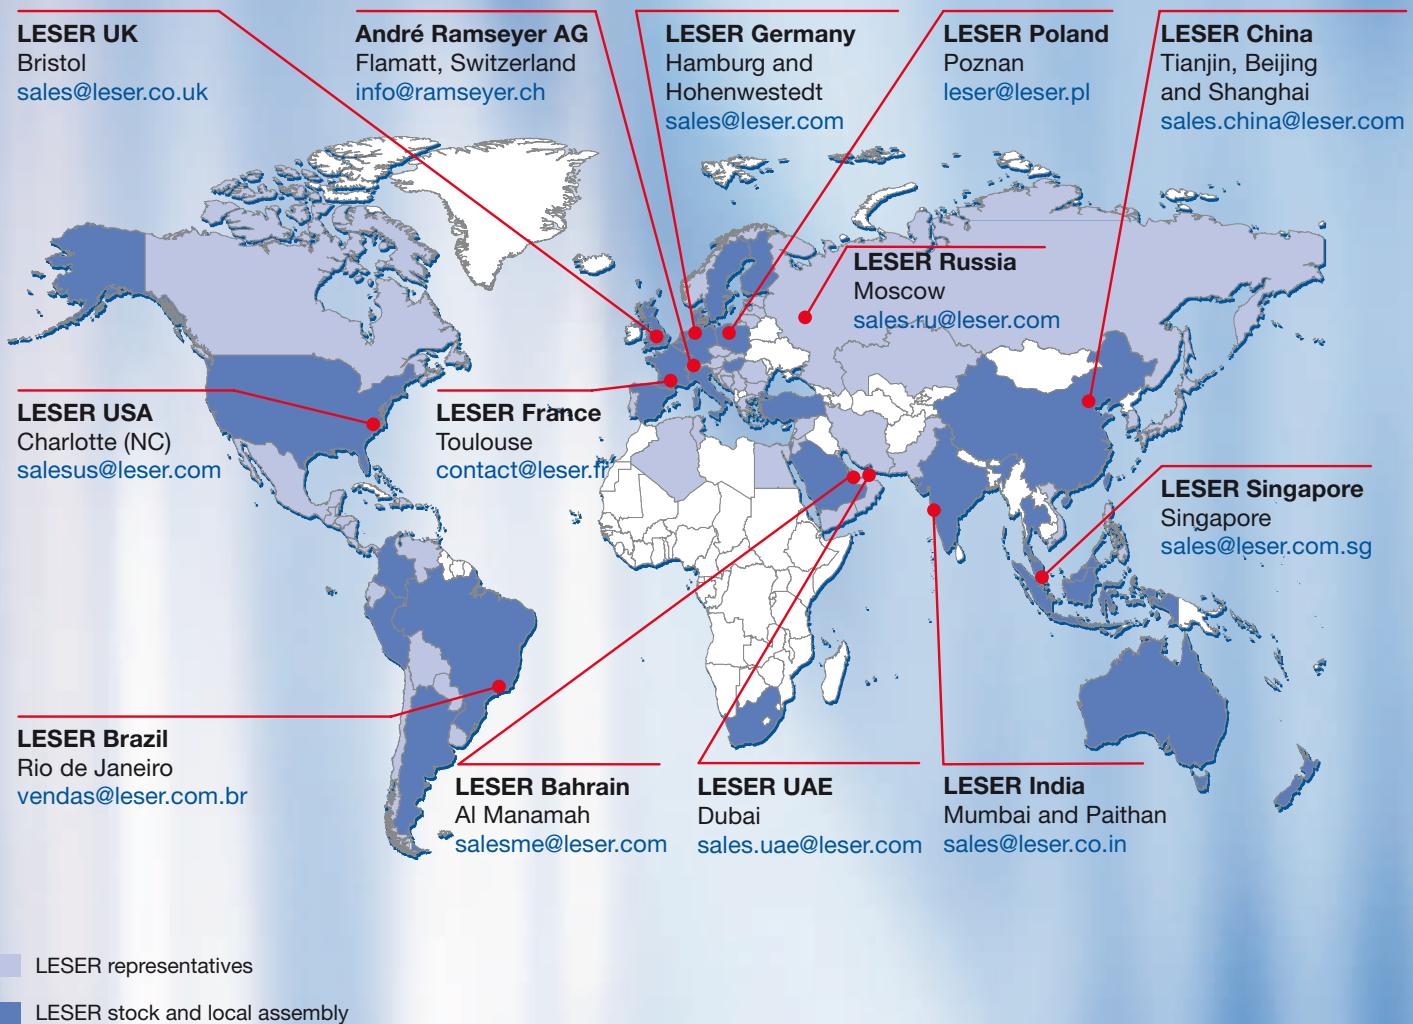

Requirements			
Code / Standards	EN ISO 4126-1, Section 5.1.3	ASME Code case 1945-4	AD 2000-Merkblatt A2, Section 10.3
Lift	≥ 30% of the full lift not less than 1.0 mm	≥ 30% of the full lift not less than 2.0 mm	≥ 30% of the full lift not less than 1.0 mm
Coefficient of discharge	– –	– –	$\alpha_w [S/G] \geq 0.08$ $\alpha_w [L] \geq 0.05$
Name plate marking	Identification of the reduced coefficient of discharge	– Capacity replaced by “Limited capacity” – Limited lift = ____ mm	Identification of the reduced coefficient of discharge
Design according to EN ISO 4126-1	For valves with a lift stopper to adapt to the required discharge mass flow, this device must not have an adverse effect on the operation of the valve. If it is adjustable, the lift stopper device must be setup such that the adjustable part can be mechanically secured and sealed. The lift stopper device must be installed and sealed by the manufacturer.
