PositionMaster EDP300 Digital Positioner

Compact, well-proven, and flexible

High air capacity

Diagnostics capability

Resistant to overpressure

Robust and environmentally ruggedized

Easy to commission

Approvals for explosion protection

- ATEX
- IECEx
- FM / CSA
- EAC TR-CU-012

For SIL2 safety loops

Advanced diagnostics

Brief description

The PositionMaster EDP300 is an electronically configurable positioner with communication capabilities designed for mounting to pneumatic linear or part-turn actuators. It features a small and compact design, a modular construction, and an excellent cost-performance ratio.

Fully automatic determination of the control parameters and adaptation to the final control element yield considerable time savings and an optimal control behavior.

Pneumatics

An I/P module with subsequent pneumatic amplifier is used to control the pneumatic actuator. The well-proven I/P module proportionally converts the permanent electrical setpoint signal from the CPU into a pneumatic signal used to adjust a 3/3-way valve.

The air flow for pressurizing or depressurizing the actuator is continuously adjusted. As a result, excellent control is achieved. When reaching the setpoint, the 3/3-way valve is closed in center position to minimize the air consumption. Four different pneumatics versions are available: for single-acting or double-acting actuators, each with "fail-safe" or "fail-freeze" function.

"Fail-safe" function

If the electrical supply power fails, the positioner output 1 is depressurized, and the pneumatic actuator's return spring moves the valve to the defined safe position. In case of a double-acting actuator the second output 2 is additionally pressurized.

"Fail-freeze" function

If the electrical supply power fails, the positioner output 1 (and 2, if applicable) is closed and the pneumatic actuator stops ("freezes") the valve in the current position. If the compressed air supply power fails, the positioner depressurizes the actuator.

Use

The positioner has a built-in LCD indicator with a multi-line LCD display and 4 operating buttons for commissioning, configuration, and monitoring during live operation.

Alternatively, the appropriate DTM/EDD can be used via the available communication interface.

Communication

The positioner supports HART5 and HART7 communication.

Inputs / Outputs

In addition to its input for the analog position setpoint, the positioner is equipped with a digital input which can be used to activate control system functions in the device. A digital output allows you to output collective alarms or fault messages.

Modular design

The basic model can be enhanced at any time by retrofitting optional equipment.

Option modules for analog and digital feedback, an emergency shutdown module, and pressure sensors for valve diagnostics can be installed.

A module for a universal analog input can also be installed to which any device supplying a 4 ... 20 mA signal can be connected.

Additionally, a mechanical position indicator, proximity switches or 24 V microswitches are available for indicating the position independently of the mother board function.

Diagnostics

The positioner has three optional pressure sensors which can be used for reliable diagnostics of the valve, the pneumatic drive, and the positioner.

Schematic diagram

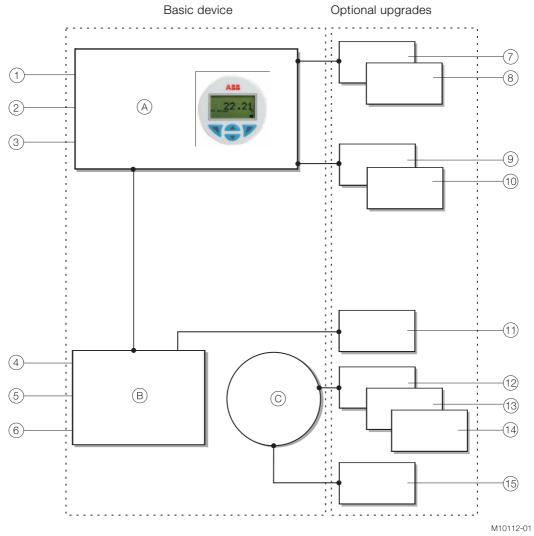

Fig. 1: Schematic diagram of the positioner

A Electronics B Pneumatics C Position sensor

1 4 ... 20 mA / Bus connection 2 Digital input 3 Alarm output 4 Supply air 5 Output 1 6 Output 2 7 Analog feedback 8 Digital feedback 9 Emergency shutdown module 1 Universal input 1 Pressure sensor 12 Limit alarm with 24 V microswitch 3 Limit alarm with proximity switch (NC) 14 Limit alarm with proximity switch (NO) 15 Visual position indication

NOTICE

In optional extensions, either the "Limit switch with proximity switch" (pos. (13) or pos. (14)) or der "Limit switch with microswitch 24 V" (pos. (12)) can be used.

It is not possible to combine both variants.

Mounting versions

Mounting to linear actuators in accordance with the standard

Lateral attachment is in accordance with DIN / IEC 534 (lateral attachment to NAMUR). The required attachment kit is a complete set of attachment material, but does not include the pipe fittings and air pipes.

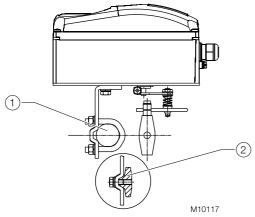

Fig. 2: Mounting to linear actuators in accordance with DIN / IEC 534

1 Columnar yoke | 2 Cast iron yoke

To pneumatic rotary actuators in accordance with the standard

This attachment is designed for mounting according to the standard VDI / VDE 3845. The attachment kit consists of a console with mounting screws for mounting on a rotary actuator. The corresponding feedback shaft adapter has to be ordered separately. Screwed pipe connections and air pipes have to be provided on site.

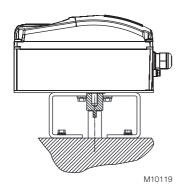

Fig. 3: Mounting to rotary actuators in accordance with VDI/VDE 3845

Integral mounting on control valves

The positioner featuring standard pneumatic action is available as an option for integral mounting.

The required holes are found at the back of the device. The benefit of this design is that the point for mechanical stroke measurement is protected and that the positioner and actuator are linked internally. No external tubing is required.

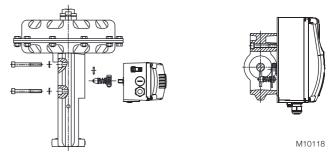

Fig. 4: Integral mounting to control valves

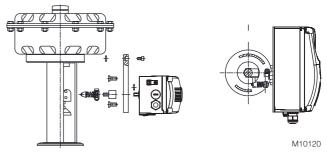

Fig. 5: Integral mounting to control valves using adapter plate

Special actuator-specific mounting

In addition to the mounting methods described above, there are special actuator-specific attachments.

External position sensors

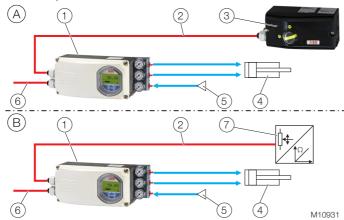

Fig. 6: EDP300 with external position sensors

- (1) EDP300 Control Unit (2) Connection cable
- (3) EDP300 Remote Sensor (4) Actuator (5) Compressed air supply
- (6) Set point signal (7) Remote position sensor

NOTICE

If the device is being operated on a cylinder, for reasons associated with linearity you should run the Auto Adjust function for rotary actuator.

(A) EDP300 control unit with EDP300 remote sensor

In this version, the components are supplied in two housings, which together form one harmonized unit.

The following points should be observed during installation:

- Housing 1 (EDP300 Control Unit) contains the electronics and pneumatics and is mounted separately from the actuator.
- Housing 2 (EDP300 Remote Sensor) contains the position sensor and is mounted on the linear and rotary actuator.

(B) EDP300 Control Unit for remote position sensor

In this version the positioner is supplied without a position sensor.

The following points should be observed during installation:

- Housing 1 (EDP300-Control Unit) contains the electronics and pneumatics and is mounted separately from the actuator.
- The remote position sensor is mounted on the linear and rotary actuator. Follow the operating instructions for the remote position sensor for mechanical mounting!

Device parameters

General remarks

Microprocessor-based position control in the positioner optimizes control. The positioner features high-precision control functions and high operational reliability. Due to their elaborate structure and easy accessibility, the device parameters can be quickly adapted to the respective application.

The total range of parameters includes:

- Operating parameters
- Adjustment parameters
- Monitoring parameters
- Diagnostics parameters
- Maintenance parameters

Operating parameters

The following operating parameters can be set manually if required:

Setpoint signal

0 ... 100 % freely selectable for split-range operation

For 4 ... 20 mA and HART version:

- Signal min. 4 mA, max. signal 20 mA (0 ... 100 %)
- Min. range 20 % (3.2 mA)
- Recommended range > 50 % (8.0 mA)

Action (setpoint signal)

Increasing:

Position value 0 ... 100 % = direction 0 ... 100 %

Decreasing:

Setpoint signal 100 ... 0 % = direction 0 ... 100 %

Characteristic curve (travel = f {setpoint signal})

Linear, equal percentage 1:25 or 1:50 or 25:1 or 50:1 or freely configurable with 20 reference points.

Travel limit

The positioning travel, i.e. the stroke or angle of rotation, can be reduced as required within the full range of 0 ... 100 %, provided that a minimum value of 20% is observed.

Shut-off function

This parameter can be set separately for each end position. When the respective configured limit value is exceeded, the shut-off function causes immediate travel of the actuator until reaching the set end position.

When the shut-off value is set to "0", the position is further controlled, even in the respective end position.

Travel time prolongation

This function can be used to increase the max. travel time for full travel. This time parameter can be set separately for each direction.

Switching points for the position

You can use these parameters to define two position limits for signaling (see option "Module for digital position feedback").

Alarm output

The alarms generated in the positioner can be polled via the digital output as a collective alarm.

The desired information can be selected via the LCD display or remotely via the configuration program.

The output can be set to "active high" or "active low", as required.

Digital input

For the digital input, one of the following safety options can be selected. You may use the LCD display or configuration program to select an option.

- No function (default)
- Move to position substitute value (freely selectable)
- Start "Partial Stroke Test"
- Ventilate output 1, evacuate output 2
- Ventilate output 2, evacuate output 1
- Service required
- Move to 0 % position
- Move to 100 % position
- Hold previous position
- Disable local configuration
- Disable local configuration and operation
- Disable all access (no local or remote access via a PC)

The selected function is activated once the 24 V DC signal is no longer applied (< 11 V DC).

Adjustment parameters

The positioner has a special function for automatic adjustment of the parameters. Additionally, the control parameters can be set automatically (in adaptive control mode) or manually to optimally adapt them to the process requirements.

Zone

Upon reaching this value, the position is readjusted more slowly until the dead band is reached.

Dead band (sensitivity)

When reaching the dead band, the position is held.

Display 0 ... 100 %

Adjusting the display (0 ... 100 %) according to the direction of action for opening or closing the actuator.

Diagnostics

Various functions for permanent operational monitoring are implemented in the PositionMaster EDP300 operating program. The following states will be detected and indicated, e.g.:

- Setpoint signal out of range 0 ... 100 % or 4 ... 20 mA
- Position out of the adjusted range
- Positioning time-out (adjustable time parameter)
- Position controller inactive
- Counter limit values exceeded (can be set via DTM/EDD)

LCD display

The LCD indicator has a cover to protect against unauthorized operation.

Commissioning the positioner is especially easy. Autoadjust is triggered by pressing just a few pushbuttons. Detailed configuration knowledge is not necessary in order to start the device.

Depending on the selected actuator type (linear or rotary), the displayed zero position is automatically adapted.

Besides this standard function, a customized "Autoadjust" function is available. The function is launched either via the LCD display or HART communication.

M10125

Fig. 7: Open positioner with view of LCD indicator

The built-in LCD indicator with four pushbuttons supports the following functions:

- Operational monitoring
- Manual intervention during live operation
- Device configuration
- Fully automatic commissioning
- Display of diagnostic messages

M10126

Fig. 8: LCD indicator with pushbuttons and LCD display

A menu-controlled configuration is available via the pushbuttons on the device.

The multi-line LCD indicator is permanently updated and adapted during operation to provide the user with optional information as relevant.

During control operation (control with or without adaptation) the following data can be called up by pressing the pushbuttons briefly:

Position Pos [%]

Position Pos [°]

Setpoint SP [%]

Setpoint SP [mA]

Control deviation DEV [%]

Electronics temperature [°C, °F, °R, K]

Supply pressure PIN [unit]

Pressure output 1PY1 [unit]

Pressure output 2PY2 [unit]

Differential pressureUniversal input value UIN [unit]

Malfunctions, alarms, messages
 The possible reason is also displayed, along with the recommended remedial action.

In the event of an error, a message consisting of a symbol and text appears at the bottom of the process screen (e. g. electronics) The text displayed provides information about the area in which the error has occurred.

The error messages are divided into four groups in accordance with the NAMUR classification scheme.

Symbol	Description
X	Error / failure
	Function check
?	Outside of the specification
***	Maintenance required

(The group assignment can only be changed using a DTM or EDD).

The error messages are also divided into the following areas:

Range	Description	
Actuator	Diagnosis notices affecting the valve or the	
	pneumatic actuator	
Operation	Diagnosis notices with a negative effect on the	
	operation of the positioner	
Process	Diagnosis notices that refer to the process and	
	display impairments or states.	
Sensor	Alarms indicating problems affecting the position	
	feedback of the valve position	
Electronic	Errors in the device electronics are displayed.	
Configuration	Detects if the positioner configuration is missing or	
	faulty	

Histograms recording

- Positioning time-outs
- Valve movements
- Valve strokes
- Most used valve position
- Universal input

Access to extended monitoring parameters is possible via HART communication, the DTM, and the EDD.

The diagnostics parameters in the operating program provide information about the operating conditions of the actuator. For example:

- Dead band time limit
- Leakage detection
- Temperature monitoring
- Stiction detection
- Sliding friction detection
- Hysteresis
- Valve seat wear

From this information the operator can derive what maintenance work is required, and when.

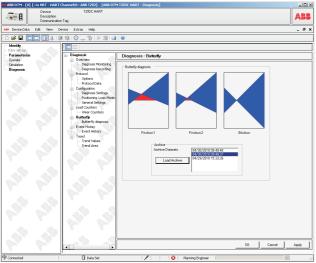

Diagnostics with DTM

Access to extended monitoring parameters is possible via HART communication, in particular the DTM (reduced functions only with the EDD).

Butterfly diagnostics

The trend (which relates to a number of relevant positioner parameter values) can be used to draw conclusions about the stiction and friction of a valve with a view to enabling preventive maintenance.

If the diagnostic parameters have changed, a triangle is displayed in signal color. The color and size of this triangle represent the direction and scope of the change.

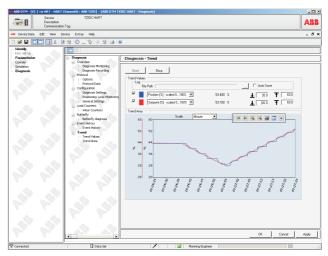

M10114

Fig. 9: Example for increased friction

Online trend archive

The online trend archive does not merely indicate the current setpoint and actual value, but also the associated patterns, which can stretch back over a matter of hours. When you start the online trend archive, the saved data is read out and transmitted at such a high transmission rate (100 ms via HART) that the latest data is displayed in next to no time.

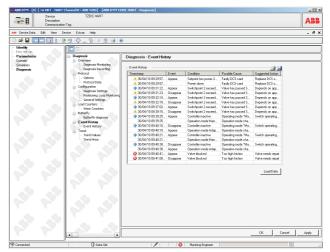

M10115

Fig. 10: Example for online trend archive

Event history

Up to 100 events are saved in the event history in the device. The time each event occurred is also displayed, along with a suggested approach to solving the problem. The limit values for (pre-)alarms, e.g. a friction alarm, can be set.

M10116

Fig. 11: Example event history

Valve signature (only with pressure option)

When the valve signature starts, the entire valve operating range is covered for the "open and closed directions". High-resolution plots are generated for the pressure patterns at the diagnostic pressure sensors. In addition, the signal waveform for the universal input is recorded. Once the signature has expired, the parameters selected by the user are loaded from the device and displayed. Depending on the quantity of data selected, it may take several minutes to transfer all the parameter values. Up to 5 valve signatures can be saved in the device; these can be compared so that valve diagnostics can be performed for the purpose of preventive maintenance.

Speed in relation to position test

When the "Speed in relation to position test" is started, the entire valve operating range is covered for the valve's "open and closed directions" in an uncontrolled manner using an adjustable degree of openness for the pneumatics. The positioning times for opening and closing the valves are displayed.

The pattern of the graph provides information about friction in the valve and actuator. Up to 5 archived graphs can be saved in the device; these can be compared so that valve diagnostics can be performed for the purpose of preventive maintenance.

Fig. 12: Example of Speed Over Position Test

Step response test

The step response allows the user to define the start position for the step change. When the start button is pressed, a setpoint step change is generated internally and a high-resolution plot is created for the valve position, pressure patterns, etc. At the end of the step response, the actuator automatically moves to the defined start position and reverts to control mode. Depending on the quantity of data selected, it may take several minutes to transfer all the parameter values and display them in the form of a graph.

The pattern of the graph provides information about friction in the valve and actuator. Up to 5 archived graphs can be saved in the device; these can be compared so that valve diagnostics can be performed for the purpose of preventive maintenance.

Valve seat test

During the valve seat test, the actuator is moved in the direction of the 0 % position with maximum force. If the user-defined tolerance window for the 0 % position or

the universal input signal is exceeded, this will be shown as an error. This error may be indicative of deposits or extreme wear of the valve seat.

If an ultrasonic sensor is used at the universal input for the purpose of measuring noise at the valve seat, even minor leakage at the valve fitting can be detected.

At the end of the test, the positioner moves the valve to the last valid position and reverts to the most recently active control mode.

Leakage test (only with pressure option)

During the leakage test, the positioner closes all pneumatic outputs. Then, if the valve position changes or there is a change in the pressure patterns at the diagnostic pressure sensors, the positioner will be able to detect leakage. It outputs a message indicating the area of the pneumatic piping or actuator that is leaking.

At the end of the test, the positioner moves the valve to the last valid position and reverts to the most recently active control mode.

Partial Stroke Test

The Partial Stroke Test is used to check the function of the safe position of ESD (emergency shutdown) valves. The test can be started both locally on the device, timecontrolled or using the DTM. The positioner evacuates output 1 until the position change defined in advance occurs. If this does not happen within the set time, an alarm can be output. This helps prevent unexpected failures of the valve. At the end of the test, the positioner moves the valve to the last valid position and reverts to the most recently active control mode.

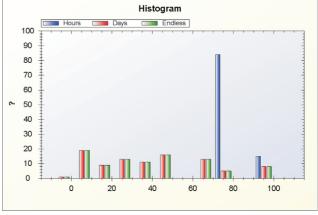

There are two separate parameters available for reducing the speed at which the valve moves in the corresponding direction.

Drag indicator

This diagram shows the minimum, maximum, and average values for a selectable parameter in 3 different intervals, which are offset in relation to one another. The drag indicator trend, which is plotted against time, makes it possible to plan preventive action so that a failure in terms of the valves and fittings can be avoided.

Trend histogram

This histogram shows, for example, the position range of the valve within which control is most frequently performed. The parameters to be displayed can be selected by the user. This graph can be used, for example, to determine the most commonly used valve position so that the valve design can be evaluated. The friction within a valve range can be determined on the basis of the differential pressure, dead band time limit alarms, etc.

M10122

Fig. 13: Example trend histogram

Trend diagram

This diagram indicates in which valve positioning range the greatest control deviation has occurred. This allows you to derive the valve friction, actuator size or supply air pressure.

Friction detection test (only with pressure option)

Once the function is initiated, a high-resolution plot of the differential pressure and universal input signal is generated for the valve's entire operating range.

At the end of the test, the positioner moves the valve to the last valid position and reverts to the most recently active control mode.

Limit values for the dynamic friction, stiction and universal input signal can be defined, using 11 reference points in each case. If the corresponding alarms are also activated in "Diagnostics -> Configure diagnostics", alarms can be output during operation as soon as the defined limit values are overshot.

Further diagnostic parameters are possible with the optional pressure sensors. They include:

- Supply air pressure too low
- Supply air pressure too high
- Pressure shocks in the supply air
- Valve signature
- Leakage localization

Additionally, limit values can be defined for these parameters. When they are exceeded, an alarm is reported.

The following values are e.g. determined:

- Number of movements performed by the actuator
- Total travel

Test cycles

Characteristic curves mapping a setpoint cyclically and internally are stored in the device. The DTM can be used to track the position of the actuator. This provides a means of checking the dynamic response of the entire actuator, for example, and determining the limit frequency automatically.

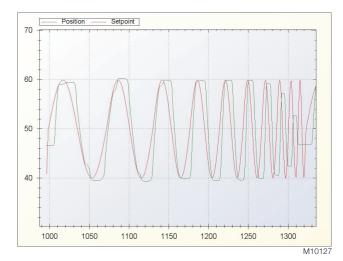

Fig. 14: Example test cycles

Communication

DTM

The DTM (Device Type Manager) for the positioner PositionMaster EDP300 is based on FDT/DTM technology (FDT 1.2/1.2.1) and can be either integrated into a control system or loaded on a PC with DAT200 Asset Vision Basic. This allows you to work with the same user interface in the commissioning phase, during operation, and for service tasks involving monitoring the device, setting parameters, and reading out data.

Communication is based on the HART protocol. Reading data out from the device has no effect on active operation. Newly set parameters are saved in the non-volatile memory directly upon download to the device, and become active immediately.

EDD

The EDD (Electronic Device Description) is used to read and modify simple device parameters on handheld terminals or in the vicinity of the system.

Specifications

Actuator travel

Rotation angle	
Used range	25 270° for rotary actuator
	25 60° for linear actuator
Actuator travel limit	Min. and max. limits, freely configurable in
	range 0 100 %
	Actuator travel (min. range > 20%
Actuator travel time	Range of 0 200 seconds, separately for
prolongation	each direction
Dead band time limit	Setting range 0 200 seconds
	(monitoring parameter for control until the
	deviation reaches the dead band)

Pneumatic connections

Input / Output	
Threaded holes	G 1/4
	1/4-18 NPT
Compressed air output	
Range	0 10 bar (0 145 psi)
Air capacity	Standard:
	$40 \text{ kg/h} = 31 \text{ Nm}^3/\text{h} = 20 \text{ scfm}$
	Optional:
	50 kg/h (40 Nm ³ /h / 23 scfm)
Output function	For single or double-acting actuators
	Air is vented from actuator or actuator is
	blocked in case of (electrical) power failure
Shut-off values	End position 0 % = 0 45 %
	End position 100 % = 55 100 %
Instrument air1)	
Purity	Maximum particle size: 5 µm
	Maximum particle density: 5 mg/m ³
Oil content	Maximum concentration 1 mg/m ³
Pressure dew point	10 K below operating temperature
Supply pressure	1.4 10 bar (20 145 psi)
Air consumption ²⁾	< 0.03 kg/h / 0.015 scfm

¹⁾ Free of oil, water and dust in accordance with DIN / ISO 8573-1. Pollution and oil content according to Class 3

²⁾ Independent of supply pressure

Accessories

Mounting material

- Attachment kit for linear actuators to DIN/IEC 534/NAMUR
- Attachment kit for rotary actuators to VDI/VDE 3845
- Attachment kit for integral mounting to control valves
- Attachment kit for actuator-specific mounting to control valves

Pressure gauge block (optional)

With pressure gauges for supply and output pressure.
 Pressure gauges with housing ø 28 mm (1.10 in), with connection block in aluminum, black

PC adapter for communication

USB-HART modem for HART communication (see data sheet 63-6.71)

PC software for remote configuration and operation

DAT200 Asset Vision Basic with DTM for EDP300 (see data sheet DS/DTM/DAT200)

Housing

Material / Degree of protection

Electrical data for inputs and outputs

NOTICE

When using the device in potentially explosive atmospheres, note the additional data in chapters "Use in potentially explosive atmospheres according to ATEX and IECEx" on page 25 and "Use in potentially explosive atmospheres in accordance with FM and CSA" on page 28!

Set point signal analog (two-wire technology)		
Terminals	+11 / -12	
Nominal operating range	4 20 mA	
Limit values	Maximum: 50 mA (overload)	
	Minimum: 3.6 mA	
Starting at	≥ 3.8 mA	
Load voltage	9.7 V at 20 mA	
Impedance	485 O at 20 m∆	

Digital input DI	
Terminals	+81 / -82
Supply voltage	24 V DC (12 30 V DC)
Input "logical 0"	0 5 V DC
Input "logical 1"	11 30 V DC
Input Current	Maximum 4 mA

Digital output DO	
Terminals	+83 / -84
Supply voltage	5 30 V DC
	(Control circuit in accordance with DIN
	19234/NAMUR)
Switching state logical	"0": Current > 0,35 mA < 1,2 mA
	"1": Current > 2,1 mA
Direction of action	standard logical "0" or logical "1"
	(configurable)

Option modules

Module for analog feedback AO1)

Without signal from the positioner (e. g. "no power" or "initializing") the module sets the output to > 20 mA (alarm level).

Terminals	+31 / -32
Signal range	4 20 mA (configurable split ranges)
Supply voltage, two-wire	24 V DC (10 30 V DC)
technology	
Characteristic curve	rising or falling (configurable)
Characteristic curve	< 1 %
deviation	

Module for digital feedback SW1, SW21)

Two switches for digital position feedback (position adjustable within the range of 0 ... 100 %, ranges cannot overlap)

Terminals	+41 / -42, +51 / -52
Supply voltage	5 11 V DC
	(Control circuit to DIN 19234/NAMUR)
Signal current	< 1,2 mA: Switching state logical "0"
	> 2,1 mA: Switching state logical "1"
Direction of action	standard logical "0" or logical "1"
	(configurable)

Module for universal input UAI¹⁾

Module for a 4 ... 20 mA input for universal use.

The range can be scaled. It is used for advanced valve diagnostics. For example, an ultrasonic sensor can be connected to detect a faulty valve seat or a phonometer can be connected to detect cavitation.

The limit values for detecting up-scaling can be freely selected.

Terminals	+21 / -22
Nominal operating range	4 20 mA
Load voltage	8 V at 20 mA
Impedance	400 Ω at 20 mA

Module for the emergency shutdown function¹⁾

When the 24 V DC signal is interrupted, the I/P module executes the respective safety function, depending on the mechanical construction.

The positioner output 1 is depressurized, and the valve is moved to the safe position. In case of a double-acting actuator, output 2 is additionally pressurized.

The emergency shutdown module works independently of the mother board, i.e., all information from the final control element is available in the control system at any time.

Terminals	+85 / -86
Supply voltage	24 V DC (20 30 V DC)
	(electrically isolated from the input signal)
Safe position	Active at < 5 V DC

¹⁾ There are two slots for the option modules. Any combination of different option modules is possible. However, identical option modules cannot be combined.

Limit switch

The limit switch can either be equipped with proximity switches or with potential-free microswitches.

Limit switch Limit 1 / Limit 2 with proximity switches

Two proximity switches for independent position signaling.		
Terminals	+41 / -42, +51 / -52	
Supply voltage	5 11 V DC	
	(Control circuit in accordance with DIN	
	19234/NAMUR)	
Output "logical 0"	< 1.2 mA	
Output "logical 1"	> 2.1 mA	
Switching point	Adjustable between 0 100 %	
Direction of action	Metal tag in proximity	Metal tag outside
	switch	proximity switch
Type SJ2-SN (NC; log.	< 1.2 mA	> 2.1 mA
1)		

Limit switch Limit 1 / Limit 2 with 24 V - microswitches

Terminals	41 / 42 / 43, 51 / 52 / 53
Supply voltage	maximum 24 V AC/DC
Load rating	Maximum 2 A

Wire cross-sectional areas

Use in potentially explosive atmospheres according to ATEX and IECEx

i NOTICE

Further information on the approval of devices for use in potentially explosive atmospheres can be found in the type examination certificates or the relevant certificates at www.abb.com/positioners.

Product identification

Depending on the type of explosion protection, an Ex name plate is attached next to the main name plate on the positioner.

This indicates the level of explosion protection and the device's relevant Ex certificate.

Installation

The installation, commissioning, maintenance and repair of devices in potentially explosive atmospheres must only be carried out by appropriately trained personnel. Works may be carried out only by persons, whose training has included instructions on different types of protection and installation techniques, concerned rules and regulations as well as general principles of zoning. The person must possess the appropriate competences for the type of work to be conducted. When operating with combustible dusts, comply with EN 60079-31.

The safety instructions for electrical apparatus in potentially explosive areas must be in accordance with Directive 2014/34/EC (ATEX) and IEC60079-14 (Installation of electrical equipment in potentially explosive areas). Comply with the applicable regulations for the protection of

i NOTICE

employees to ensure safe operation.

Observe the device's applicable specifications and special conditions in accordance with the type examination certificate or other certificates!

- Any manipulation of the device by users is not permitted.
 Only the manufacturer or an explosion protection specialist may modify the device
- The device may only be operated with instrument air that is free of oil, water, and dust.

Cable gland

Limited temperature range of the M20 x 1.5 plastic cable gland for explosion protection variants.

The permissible ambient temperature range of the cable gland is -20 ... 80 °C (-4 ... 176 °F). When using the cable gland, make sure that the ambient temperature is within this range. The cable gland must be installed in the housing with a tightening torque of 3.8 Nm. When installing the connection of the cable gland and cable, check for tightness to ensure that the required IP rating is met.

Operation with flammable gas

Observe the following points when operating a device with flammable gases:

- The device must be used in accordance with the specifications in the relevant certificate.
- Only the design with the "Intrinsic Safety" type of protection has been approved for operation with natural gas. The pneumatic outputs must be vented in non-Ex areas.
- The maximum ambient temperature must not exceed 60 °C (140 °F).
- During operation with flammable gases in type of protection "Ex n", the device may only be operated with approved cable glands.
- During operation with flammable gases, the cover cap for the air outlets can be removed, and the air outlets can be tubed separately. Both pipes may not be joined in one pipe.

Use in areas with combustible dust

Observe the following points when operating a device with combustible dust:

To prevent loss of type of protection, the housing may not be opened.

- Only use cable glands which are approved for the type of protection and correspond to IP rating ≥ IP 6X.
- Avoid hazardous propagating brush discharge.

Operation in temperature class T6

During operation in temperature class T6, when the equipment is partially or fully depressurized, ensure that there is no possibility of a hazardous atmosphere getting into the pneumatic system or that any hazardous atmosphere is removed prior to compression by taking suitable action. When commissioning in temperature class T6, flush the pneumatic system with 1.4 (+/- 0.1) bar until all traces of any explosive mixture have been removed (at least 5 minutes). Ventilate and evacuate the EDP300 fully several times.

Installation

The installation, commissioning, maintenance and repair of devices in areas with explosion hazard must only be carried out by appropriately trained personnel.

The operator must strictly observe the applicable national regulations with regard to installation, function tests, repairs, and maintenance of electrical devices. (e.g. NEC, CEC).

I NOTICE

Observe the device's applicable specifications and special conditions in accordance with the relevant certificate.

- Any manipulation of the device by users is not permitted.
 Only the manufacturer or an explosion protection specialist may modify the device
- The device may only be operated with instrument air that is free of oil, water, and dust.

Cable gland

Limited temperature range of the M20 x 1.5 plastic cable gland for explosion protection variants.

The permissible ambient temperature range of the cable gland is -20 \dots 80 °C (-4 \dots 176 °F). When using the cable gland, make sure that the ambient temperature is within this range. The cable gland must be installed in the housing with a tightening torque of 3.8 Nm. When installing the connection of the cable gland and cable, check for tightness to ensure that the required IP rating is met.

Operation with flammable gas

Observe the following points when operating a device with flammable gases:

- The device must be used in accordance with the specifications in the relevant certificate.
- Only the design with the IS "Intrinsic Safety" type of protection may be operated with natural gas. The pneumatic outputs must be vented in non-hazardous areas.
- During operation with flammable gases, the cover cap for the air outlets must be removed, and the air outlets can be tubed separately. Both pipes may not be joined in one pipe.
- The maximum ambient temperature must not exceed 60 °C (140 °F).

See also Control Drawing 901305.

Use in areas with combustible dust

Observe the following points when operating a device with combustible dust:

To prevent loss of type of protection, the housing may not be opened.

- Only use cable glands which are approved for the type of protection and correspond to IP rating ≥ IP-6X.
- Avoid hazardous propagating brush discharge.

Operation in temperature class T6

During operation in temperature class T6, when the equipment is partially or fully depressurized, ensure that there is no possibility of an explosive atmosphere getting into the pneumatic system or that any explosive atmosphere is removed prior to compression by taking suitable action. When commissioning in temperature class T6, flush the pneumatic system with 1.4 (+/- 0.1) bar until all traces of any explosive mixture have been removed (at least 5 minutes). Ventilate and evacuate the EDP300 fully several times.

Temperature data

i NOTICE

Legibility of the display is guaranteed at an ambient temperature of -20 ... 70 °C. At -20 °C and lower, legibility can become limited. Legibility can be compensated by adjusting contrast. Contrast adjustment can be made manually directly on the device.

The display can fail at temperatures below -20°C. Moreover, functioning of the device is guaranteed up to -40°C.
